Beijing-Dublin International College

SEMESTER I FINAL EXAMINATION - 2016/2017

School of Computer Science

BDIC Final Exam COMP3014J Performance of Computer Systems

HEAD OF SCHOOL: Pádraig Cunningham
MODULE COORDINATOR: Lina Xu*

Time Allowed: 120 minutes

Instructions for Candidates

All questions carry equal marks. The distribution of marks in the right margin shown as a percentage gives an approximate indication of the relative importance of each part of the question.

BJUT Student ID: _____ **UCD Student ID: _____**

I have read and clearly understand the Examination Rules of both Beijing University of Technology and University College Dublin. I am aware of the Punishment for Violating the Rules of Beijing University of Technology and/or University College Dublin. I hereby promise to abide by the relevant rules and regulations by not giving or receiving any help during the exam. If caught violating the rules, I accept the punishment thereof.

Honesty Pledge：_____ (Signature)

Instructions for Invigilators

Non-programmable calculators are permitted.
No rough-work paper is to be provided for candidates.

Obtained score
20

Question 1: General Theories on Performance

a. What are the three common performance evaluation techniques and when to use them? Talk a little bit about their advantages and disadvantages. (5 Marks)

b. Explain what is workload in your own words. In the LEACH evaluation, what has been used as workload to test the performance? (3 Marks)

c. Workload Selection is essential for performance evaluation. Give your ideas and opinions on workload selection in terms of level of details. (4 Marks)

d. Present a system and propose a performance evaluation strategy for it. You need to describe what is the system, evaluation methods, workload selection and other relevant information. (8 Marks)

Obtained score
20

Question 2: Workload Characterization

a. What are the differences between factors and metrics? Present the answer in your own words and also give some examples for both. (5 Marks)

b. When analysing data, what can clustering method do? Write the clustering algorithm based on minimal spanning tree in pseudo-code. (7 Marks)

c. What is the main advantages to apply Principal Component Analysis (PCA) when analysing high dimensional dataset? Given the following eigenvalues and eigenvectors, which vector is the principle component of the dataset? (8 Marks)

$$eigenvalues = \begin{pmatrix} .0490833989 \\ 1.28402771 \end{pmatrix}$$

$$eigenvectors = \begin{pmatrix} -.735178656 & -.677873399 \\ .677873399 & -.735178656 \end{pmatrix}$$

Obtained score
20

Question 3: Summarize Measured Data

a. What is QQ plot and what purpose is it normally used for? Give examples to clarify your point. (6 marks)

b. A university wants to know more about the knowledge of students regarding international events. They are concerned that their students are uninformed in regards to new from other countries. A standardized test is used to assess students' knowledge of world events (national reported mean=65, S=5). A sample of 30 students from this university are tested (sample mean=58, Standard Error=3.2). Can Can we say with 99% confidence that the university result is below the national standard? What about 95% confidence? (6 Marks)

c. Deduce the linear regression process with one dependent variable Y and one independent variable X. What is R^2 indicating in linear regression and how to calculate it? (8 Marks)

Obtained score
25

Question 4: Queuing Model

a. In queuing theory, what do the terms M/M/1, M/M/n, M/M/n/K stand for? (3 Marks)

b. In Beijing, supposedly the birth rate λ and the death rate is μ. Both follow Poisson distribution. π_n is referred as the possibility for the population = n. Deduce the value for π_n if π_0 is known. (6 marks)

c. For an M/M/1 queue we know that the mean number of customers in the system (L) is equal to the utilization divided by one minus the utilization. Using basic laws and relationships, derive the mean wait in the system (W), the mean number of customers in the queueing area (L_q), and the mean wait in the queuing area (W_q) as a function of the utilization. (6 Marks)

d. Customers arrive in a usual M/M/1 system, with an arrival rate λ and service rate μ. However, in some system, the customers in the queue are impatient: Each customer waiting in the queue will abandon the system without receiving service with a rate γ. Draw the Markov Chain diagram for this queue and derive the stationary probability π_i in this chain. (10 Marks)

Obtained score
15

Question 5: Simulation

a. We say a simulation evaluation is good if it is validated and verified. Explain in your own words what are validation and verification. (5 Marks)

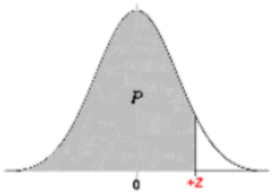
b. Supposedly you are a project manager in a car company and your team is going to test an auto driven system through simulation. Talk about the general approach you should follow in order to avoid common mistakes. (5 Marks)

c. For simulation, random number generation is open required. Linear-Congruential Generators are the popular ones that can be applied efficiently. Explain how can you obtain a full period generator. (5 Marks)

Appendix :

Tables of the Normal Cumulative Distribution

The table below gives the probability p that a Standard Normal random variable Z (ie mean = 0 and variance = 1) is less than or equal to z.



z =	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
