

### **Beijing-Dublin International College**

# SEMESTER I RESIT EXAMINATION - 2017/2018

**School of Computer Science** 

#### **BDIC Final Exam COMP3014J Performance of Computer Systems**

HEAD OF SCHOOL: Pádraig Cunningham MODULE COORDINATOR: Lina Xu\*

Time Allowed: 120 minutes

#### **Instructions for Candidates**

All questions carry equal marks. The distribution of marks in the right margin shown as a percentage gives an approximate indication of the relative importance of each part of the question.

BJUT Student ID:	UCD Student ID:
I have read and clearly understand the	e Examination Rules of both Beijing University o
Technology and University College Dub	lin. I am aware of the Punishment for Violating the
Rules of Beijing University of Techno	logy and/or University College Dublin. I hereby
promise to abide by the relevant rules a	and regulations by not giving or receiving any help
during the exam. If caught violating the r	rules, I accept the punishment thereof.
Honesty Pledge:	(Signature)

#### **Instructions for Invigilators**

Non-programmable calculators are permitted.

No rough-work paper is to be provided for candidates.

Obtained score
20

# Question 1: General Theories on Performance

- a. What are the three common performance evaluation techniques and when to use them? Talk a little bit about their advantages and disadvantages. (7 Marks)
- b. In the paper group reading assignment, what is the system described your paper?

  What evaluation methods, workload and metrics were used? (8 Marks)
- c. In simulation, random number generation is open required. Linear-Congruential Generators are the popular ones that can be applied efficiently. Explain how can you obtain a full period generator. (5 Marks)

Obtained
score
20

### Question 2: Workload Characterization

- a. What are the differences between factors and parameters? Present the answer in your own words and also give some examples for both.
   (5 Marks)
- b. Consider a workload with five components and two parameters. The CPU time and the number of disk I/O's were measured for five programs. The parameter values after scaling are as shown in Table below. Based on the information given in the table, among all the other four programs, which one has the most similarity as A? (8 Marks)

Program	CPU Time	Disk I/O		
A	2	4		
В	3	5		
C	1	6		
D	4	3		
E	5	2		

c. What is the main advantages to apply Principal Component Analysis (PCA) when analysing high dimensional dataset? Given the following eigenvalues and eigenvectors, which vector is the principle component of the dataset?

**Semester One** 

(7 Marks)

$$eigenvalues = \begin{pmatrix} .0490833989 \\ 1.28402771 \end{pmatrix}$$
 
$$eigenvectors = \begin{pmatrix} -.735178656 & -.677873399 \\ .677873399 & -.735178656 \end{pmatrix}$$

Obtained	
score	
30	

# Question 3: Summarize Measured Data

- a. In general, what are QQ plots used for? What is the main advantage of q-q plots over histograms? (5 Marks)
- b. Do the following values come from a normal distribution? Demonstrate the process. 7.19, 6.31, 5.89, 4.5, 3.77, 4.25, 5.19, 5.79, 6.79. (14 Marks)
- c. A random sample of 225 first year statistics tutorials was selected from the past 5 years and the number of students absent from each one recorded. The results were: sample mean x =11.6 and standard deviation  $\sigma$  =4.1 absences. Calculate the mean number of absences per tutorial over the past 5 years with 90% confidence. (7 Marks)
- d. In linear regression, what is the definition for coefficient of determination? What it means? (4 Marks)

Obtained score

## Question 4: Queuing Model

a. M/M/1 model is a special case for birth and death model, where  $\lambda_k = \lambda$ , k = 0,1,... and  $\mu_k = \mu$ , k = 1,2,... Deduce the following formula

$$L = \frac{\lambda}{\mu - \lambda} \text{ provided } \lambda < \mu$$

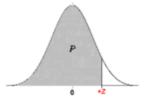

Where L is the mean number of customers in the system. Then use basic laws and relationships, derive the mean wait in the system (W). (12 Marks)

b. Customers for a bank arrive in a usual M/M/1 system, with an arrival rate  $\lambda_i$  and service rate  $\mu_i$ , where i is the existing customers in the bank. If  $\mu_i = \mu$  for i = 0, 1, 2....  $\lambda_i = \lambda/(i+1)$  for i = 0, 1, 2.... Draw the Markov Chain diagram for this queue and derive the stationary probability  $\pi_i$  in this chain. (18 Marks)

#### Appendix:

#### **Tables of the Normal Cumulative Distribution**

The table below gives the probability p that a Standard Normal random variable Z (ie mean = 0 and variance = 1) is less than or equal to z.

z =	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
